**WAR-63-PRIORITY PROJECT  
(WAR-63-0.83 ODOT PID 105399)**

**WARREN COUNTY, OHIO**

**RL RECORD LLC Consultants  
and SHA Engineering LLC**

**for the**

**Warren County Transportation Improvement District**

**April 2019  
Update June 2019**

## Initial Assessment

An initial assessment of road traffic safety conditions, crash rates and crash reports was conducted for the whole of the WAR-63 corridor as part of the April 2017 *Scoping Study* (see Attachment A). This work found that the crash rate for the 2013-2015 available data analysis period averaged about 3.75 crashes per MVMT, about 2.3 times the Ohio statewide average rate for same type facilities in that period. For the portion of the overall corridor including the WAR-63 Priority Project, the crash rate in that period was about 3.20 per MVMT, about twice the statewide average in that period.

## Updated Review and Assessment

In April 2019, updated crash data was obtained for the WAR-63 Priority Project portion of the overall corridor covering the years 2016-2018 (Ohio DOT Crash Analysis Module Tool). Crash reports were compiled and evaluated, and a project-length crash history diagram was prepared for the Priority Project length (see Attachment B). Data and graphical analyses of crashes were completed, and histograms of crash frequency, distribution, cause, road conditions were prepared (see Attachment C).

For the most recent 3-year period of available data (2016-2018), the crash rate was about 2.37 per MVMT, remaining at about twice the current statewide average for same type facilities, which has declined slightly in the most recent 3-year period compared to the previous 3-year period. In this 2016-2018 period, crashes broke down as follows:

Fatal Crashes	0.8% of total
Injury Crashes	26.2% of total
Property Damage Only Crashes	73.0% of total

Other general attributes of crash occurrences on the WAR-63 Priority Project segment of the overall corridor (cause, distribution, etc) remain essentially unchanged since the 2013-2015 examination.

Most crashes on the WAR-63 Priority Project segment occur during peak traffic periods, speaking to both cause and resultant effect and impacts. High traffic periods have the greatest physical, modal and trip type conflicts, and also the greatest risk for involving multiple vehicles

in cause or impact. The single largest hour for crash occurrence is the 5 to 6 PM period (10.3%), and 57% of all crashes occur in the noon to 7 PM high travel period, often causing extensive backups and delays, or even extended road closures, on the narrow and congested facility.

Crashes are occurring while vehicles are slowing, or stopped in traffic. Rear-end collisions accounted for 55% of crashes in the 2016-2018 period; 25% of all rear end crashes had injuries. Rear end crashes are often the result of unexpected reductions in speed or sight distance. Speed disparity among modes (trucks versus other) is an important and growing causative issue, based on field observations. Distracted driving is a suspected, but not typically reported, contributing factor.

Fixed object crashes were second most common single crash category, at 12% of all crashes; however these produced a high injury rate at 47% of all fixed object crashes. These are "run off the road" crashes, often the result of trying to avoid a rear-end collision, or otherwise a loss of control and lane departure. Clear zone obstacles, including utility poles, culverts, headwalls, and signs, are significant in the corridor.

Sideswipe and angle accidents (combined) produced 16% of all crashes, but only 30% of these were with injury.

Approximately 200 feet of vertical relief occurs along the study corridor, and about 44% of the existing roadway has sections of significant vertical grade of up to 5%. One 830-foot stretch of roadway exhibits grades in excess of 7%. However, only about 22% of all crashes in the corridor occur on these horizontally straight, significant vertical grade and transition sections, indicating that factors other than vertical grade dominate crash distribution and occurrence.

Following rear-end and fixed object and angle crashes, collisions with animals are next most common, accounting for 8% of all reported crashes.. Animal crashes often go unreported if there is no significant damage or injury, so actual frequency is unknown.

Similar to previous examination years, 74% of all crashes were described as "not at an intersection", indicating the likely result of introduction of unexpected maneuvers, including slowing and stopping near congestion queues, disparate speed platoons and access points.

## Update on Safety Countermeasures and Relationship to WAR-63 Priority Project

A number of road safety countermeasures were recommended as an outcome of the initial safety assessment (April 2017). A few additional countermeasures have been identified as a product of the Updated Review and Assessment.

Table A below identifies initial and additional safety countermeasures, and how each is being addressed in the WAR-63 Priority Project currently being forwarded for implementation.

<b>TABLE A. Safety Countermeasures for the Project Corridor and Incorporation in the WAR-63 Priority Project</b>				
Recommended Countermeasure	From Safety Assessment:		Incorporation in the WAR-63 Priority Project	Remarks
	Initial 2017	Update 2019		
<b>Widen Shoulders</b> – Widen shoulders and clear zones to reduce fixed object accidents, as well as reduce road closures due to accidents.	✓	✓	✓ Priority Project will provide full 8-foot paved safety shoulders, and clear zone improvements.	Major utility pole hazards removal and relocation.
<b>Widen Substandard Lanes</b> – Provide consistent 12 foot lanes, physical and visual (including striping effects)	✓	✓	✓ Priority Project will provide modern standard-width lanes and pavement markings	Profile and clear zone improvements will also achieve safer perceived lane width
<b>Flatten Vertical Curves</b> – Reduce sight and stopping distance problems associated with the vertical profile of the roadway.	✓	✓	✓ Priority Project will provide and improved and safer vertical profile	Multiple lanes and wider shoulders also help mitigate profile related crash risk
<b>Protect Turning Movements</b> Reduce unexpected movements resulting from unprotected access points.	✓	✓	✓ Adopted access management plan and intersections designs will provide protected turn movements	Problem driveways will be consolidated, or eliminated over time.
<b>Traffic Calming</b> –Rumble strips on vertical curves or sight distance locations.	✓	--	X Not recommended/not incorporated	Not practical or effective for improved profile project.
<b>Access Management</b> – Reduce the number of access conflict points.	✓	✓	✓ Adopted access management plan will reduce access point conflicts.	Also aids sustenance of facility capacity and through-put
<b>Enhanced Warning Signage</b> Provide next generation animal crossing warning signs at concentrated crossing zones.	✓	✓	✓ Warning signs will be scheduled in final design and installed as part of project	New low-cost technologies in warning systems and signage may be explored in project procurement.
<b>Way finding</b> – Provide directional signage to reduce driver distraction and speed disparity.	✓	✓	✓ Priority Project will provide improved wayfinding and operational signage	Integration low-cost technologies will be explored in project procurement.

<b>TABLE A. Safety Countermeasures for the Project Corridor and Incorporation in the WAR-63 Priority Project</b>				
Recommended Countermeasure	From Safety Assessment:		Incorporation in the WAR-63 Priority Project	Remarks
	Initial 2017	Update 2019		
<b>Safety Grading</b> – Provide safety grading of ROW embankment to reduce injury hazard	--	✓	✓ Priority Project will provide improved safety grading in all portions of ROW	Possible special safety treatments needed at certain utilities and drainage locations
<b>Safety Median</b> – Provide safety median between opposing lanes	--	✓	✓ Priority Project can or will incorporate safety median of varying performance levels	Safety median section will be explored in project procurement; evaluated for Life Cycle and Benefit-Cost
<b>Technologies – Intersection and Traffic Flow Management</b> – Improve net flow and reduce cross traffic and disparate speed conflicts	--	✓	✓ Priority Project anticipated to incorporate low cost new generation technologies for intersection and flow control and optimization, prioritization	ITFM will be explored in project procurement; will provide safety benefits in maintaining safer traffic flow; may link to VSL, below
<b>Technologies – Smart Roadway Lighting</b> – Use active lighting to improve net visibility and improve safety at key locations	--	✓	✓ Priority Project anticipated to incorporate low cost manageable lighting technologies at key locations; may link to ITRM	SRL will be explored in project procurement; will provide safety benefits from better visibility under changing conditions
<b>Technologies – Variable Speed Limits</b> – Provide active VSL to improve flow and safety, reduce speed conflicts	--	✓	✓ Priority Project anticipated to incorporate Variable Speed Limits with changeable electronic signage, possibly linked to intersection and flow control technologies	VSL will be explored in project procurement; will provide safety benefits in periods of incidents, events congestion, low visibility, or other poor drivability conditions
<b>Technologies – Performance Pavement Design</b> – Provide open graded drainage/high traction pavement design to improve poor weather safety	--	✓	✓ Priority Project anticipated to incorporate Open Graded Friction Course for wet and dry weather traction, control and safety improvement	OGFC is higher first cost but will be explored in project procurement; some tire/pavement noise benefit also anticipated

**ATTACHMENT A** INITIAL SAFETY ASSESSMENT (APRIL 2017 *SCOPING STUDY*)

## **Agricultural and Related Conflicts**

This has historically been a major and looming traffic planning and safety issue: at peak operation, the LCI/WCI complex was generating more than 70 agricultural equipment crossings of SR 63 each day. Ag operations recently have been permanently ceased at the penal institutions. Other farm vehicle activity in the corridor is limited, but does occur, including heavy (and slow) farm-to-market grain trucks during harvest season.

## **Speed Enforcement**

Speed enforcement by motor patrol is not a major presence in the corridor. It is hypothesized that, in large part, there is no safe shoulder area in the system to pull over during enforcement actions.

## **Emergency Access**

Emergency vehicles regularly use SR 63 in responding to calls in the general area and Turtlecreek Township, including responding to crashes on SR 63 itself.

## **Incident Management**

There is no formal incident management support assignment to the corridor. It is noted that most serious/injury crashes shut down or seriously impede the highway for several hours or part of a day due to difficult access and lack of safety shoulder.

## **Safety**

Summary crash information is presented in **Figure A-3 on Page 26**.

Compiled crash data for the period 2013-2015 is found in **Appendix C**.

Two Safety Integrated Priority Project (SIP) locations are located along the SR 63 Corridor in the study area. The first is located immediately east of Gateway Blvd., outside of the Monroe Corporation line. This is a High Priority Segment. Additionally, a Low Cost Improvement Section is located east of the Markey Rd. Intersection.

## **Crash Trends**

The SR63 Corridor is currently experiencing crash rates at more than twice the statewide average for similar facilities<sup>22</sup>. The average crash rate for the entire 5.4 mile corridor in the 2013-2015 analysis period was 3.75 crashes per Million Vehicle Miles, about 2.2 times the statewide average. Breaking this down further, the rate was 3.20 per MVM west of SR741, and 4.55 per MVM east of SR741. Crash frequency is increasing as traffic volumes increase. This indicates that the facility is approaching its “tipping point”, that level where the crash rate increases abruptly due to saturation of the roadway capacity, increased stops and turns, and increased opposing traffic, leaving no margin for driver error. This correlates with a high crash frequency during peak periods. The single largest hour for crash occurrence is the 5 to 6 PM period (12.2%), and more than half of all crashes occur in the noon to 7 PM high travel period.

Crashes are occurring while vehicles are slowing, or stopped in traffic. Rear-end collisions account for 49% of crashes, with “following too closely/failure to provide assured clear distance” also cited in 49% of crashes. Rear end crashes are often the result of unexpected reductions in speed or sight distance.

Geometry plays a role in crash location. Approximately 200 feet of vertical relief occurs along the study corridor. One 830-foot stretch of roadway exhibits grades in excess of 7%. About 31% of all crashes in the study area occur on horizontally straight, vertical grade conditions. Ten crashes occurred at log points 4.12 – 4.22, a sag curve with several drives and limited sight distance.

---

<sup>22</sup> The 2013 Ohio Statewide average for 2-lane undivided rural highways was 1.68/MVM

After rear end collisions, fixed object “run off the road” crashes, account for the second highest crash frequency type at 17%. These crashes are often the result of trying to avoid a rear-end collision, or loss of control.

Following rear-end and fixed object crashes, angle crashes and collisions with animals are next most common, accounting for 7 and 6% of all reported crashes, respectively. Animal crashes often go unreported if there is no significant damage or injury, so actual frequency is unknown.

While 77% of crashes are described as “not at an intersection”, a significant number occurred at several high frequency locations proximal to problematic access points: in the MVG Gaming area, approaching the SR 741 intersection, in high driveway count areas east of SR 741, and in the high access point transition zone to the City of Lebanon. These crash concentrations are likely result of introduction of unexpected maneuvers, including slowing and stopping near access points.

Crashes with injuries or fatalities generally correlate to more severe accidents of greater concern in safety planning. About 26% of all accidents in the SR 63 corridor have injuries (including fatalities). The distribution and clustering of these injury/fatality accidents was examined separately, with the general findings illustrated on **Figure A-3 on Page 26**. The red ellipses on Figure A-3 indicate where concentrations of the most severe and injury-causing crashes have been occurring, out of proportion to the rest of the corridor.

### **Contributing Factors and Emerging Issues**

**Driver Expectations** – SR63 has historically functioned as a rural arterial connecting the cities of Lebanon and Monroe. Because of its mostly rural setting and character, the roadway does not exhibit the cues that motorists associate with the need for caution. Narrow shoulders, open ditches, utility poles, adjacent visual encroachments, unpredictable driveways and access points, and confusing lane transitions combine to create a “busy” cognitive condition for motorists, especially those not familiar with the route.

**Trip Type and Modal Conflicts** – Changes in user mix and and traffic volumes, including the introduction of a significant fraction of heavy truck trips and increased commuter and convenience trips are still travelling on the original two-lane facility, resulting in growing conflicts in travel speed and driver behavior among vehicles.

**Access Management** – A number of problematic access points, some exacerbated by vertical curve and sight distance conditions exist along the route. Legacy residential drives, institutional entrances with increased ingress/egress volumes, slow moving farm and maintenance vehicles, along with the introduction of drivers not familiar with the area, have amplified the importance of access improvements.

**Roadway Geometric Characteristics** – Although the roadway is extremely straight with very few horizontal curves, its vertical geometry – significant ups and downs with associated sight distance problems – contributes to unpredictable speeds and driver behavior.

### **Potential Countermeasures**

The following counter-measures could reduce impacts of crashes regardless of long-range strategies or short-term projects selected:

**Widen Shoulders** – Widening shoulders could reduce the impact of fixed object accidents, as well as reduce road closures due to accidents.

**Widen Substandard Lanes** – Lane widths in some sections is well less than the standard and driver-expected 12 feet.

**Flatten Vertical Curves** – Significant sight and stopping distance problems associated with the vertical profile of the roadway exist.

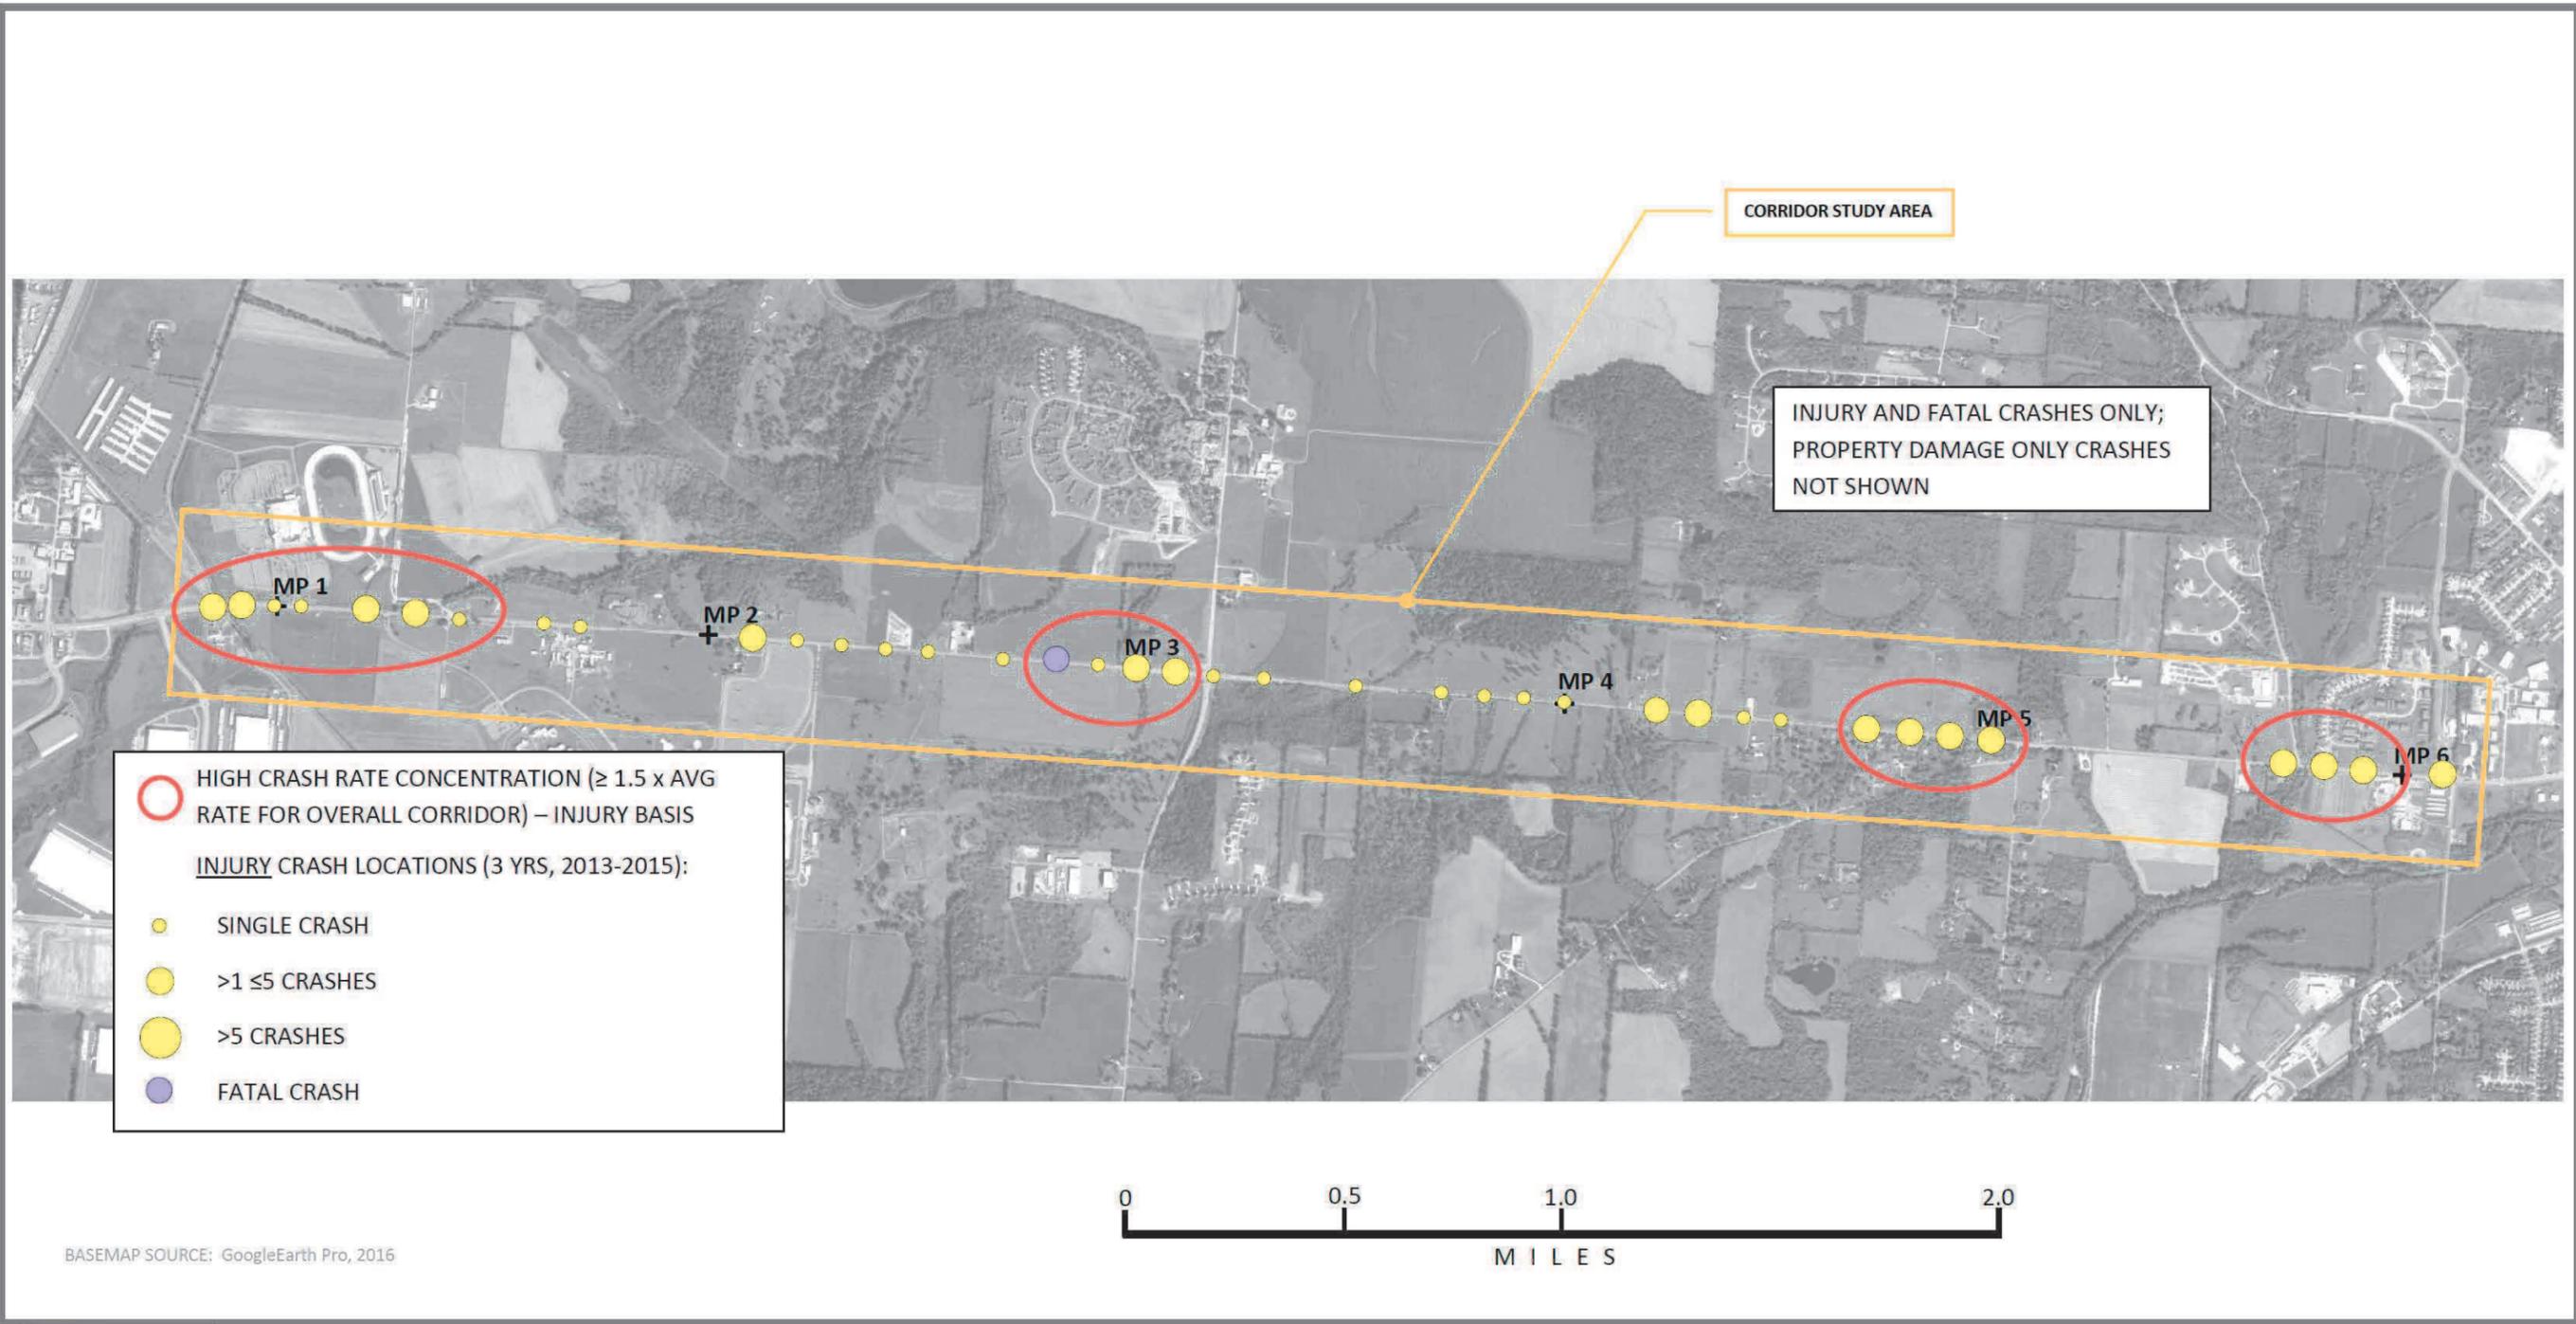

**Protect Turning Movements** – Alternative intersection designs could reduce unexpected movements resulting from unprotected access points.

**Traffic Calming** –Rumble strips could reduce speeds on vertical curves.

**Access Management** – Reducing the number of conflict points should be part of a long-range sustainable solution.

**Enhanced Warning Signage** – Animals generally develop repeatable habits. Next generation warning signs could identify concentrated crossing zones.

**Way finding** – Clear directions reduce driver distraction and improve safety.
